

Treatment for Neuropathic Pain Including Peripheral Neuropathies

Peripheral Neuropathies include a vast number of causes and conditions. Included in this list are the common ailments of Diabetic Polyneuropathy, Chemotherapy Induced Poly Neuropathy (from cancer drug therapy or HIV drug therapy), chemical toxins such as heavy metal poisoning, vitamin deficiencies, systemic diseases such as Amyloidosis, Hypothyroidism, Lyme Disease, Syphilis, and many others. Also, a very prominent cause of pain and numbness in the upper and lower extremities are the hereditary polyneuropathies including the disease known as "Charcot-Marie-Tooth Disease" (CMT).

The most common disorders are the polyneuropathies of Diabetes Mellitus and Chemotherapy Induced Peripheral Neuropathy (CIPN) as well as other toxic chemical neuropathies.

Your primary care physician can determine through a thorough physical exam including detailed history, neurological exam, blood testing, and various radiological evaluations the nature of your neuropathy. He may even refer you to a neurologist, a specialist in neurological diseases, to better define your illness and recommend specific therapy. Scrambler Therapy can play a major adjunctive roll in your treatment plan and may be able to restore normality to the processing of your peripheral nervous system relieving the burning, numbness, and pain associated with peripheral neuropathic diseases.

At CALMARx Pain Relief Therapy, we have successfully treated many patients suffering from various chronic neuropathic disorders.
